

CASE STUDY

DevOps Transformation & Assessment for Telecommunication Platform (Tozcall)

Server Administrator
Kamran

Executive Summary

A DevOps assessment was conducted for **Tozcall**, a telecommunication service provider, to evaluate its software delivery processes and operational efficiency. The objective was to identify and resolve gaps in automation, infrastructure management, monitoring, and incident response affecting network services, customer portals, and billing systems. Our team focused on improving system reliability, reducing downtime, and enabling faster rollout of telecom services and updates for **Tozcall**.

Recommended DevOps Improvements

To address these challenges for **Tozcall**, we implemented the following solutions:

- 1 **Automated CI/CD pipelines for faster telecom service deployments**
- 2 **Implemented Infrastructure as Code (IaC) for consistent environments**
- 3 **Improved monitoring for real-time network and service visibility**
- 4 **Established a faster incident response to reduce downtime**
- 5 **Integrated security checks into CI/CD pipelines**
- 6 **Improved collaboration between the network, DevOps, and development teams**

Assessment Scope

The DevOps audit reviewed key operational areas, including CI/CD pipeline efficiency, infrastructure as code (IaC), cloud and network scalability, incident response, monitoring, security controls, and team collaboration to support **Tozcall's** telecom platforms such as billing systems, customer apps, and network management services.

Key Findings (Deployment Pipeline)

The deployment pipeline lacked automation, causing delays in service updates and network-related releases at **Tozcall**.

- **Manual Deployment Processes**

Telecom updates and billing changes were deployed manually, causing delays and errors.

- **No Standard CI/CD Pipeline**

Different telecom systems used inconsistent deployment workflows.

- **Slow Release Frequency**

Long release cycles delayed service and network updates.

Results

Implementing these DevOps improvements enabled **Tozcall** to achieve faster telecom service deployments, improved network stability, better system monitoring, and reduced downtime. Overall, it enhanced service reliability, operational efficiency, and customer experience across telecom platforms.
